To: Hiring Team, Services Department | Backbase

Position: Solution Architect (Lebanon - Services Hub) – Job ID #7938208

Dear Backbase Hiring Team,

I am writing to express my strong interest in the Solution Architect position within your Services team in Lebanon (Job #7938208). I am currently based in Cairo and am relocating to Lebanon independently, requiring no visa sponsorship or relocation logistical support from Backbase. I am fully prepared to establish my base in Lebanon immediately and undertake the extensive regional travel required for client inception phases and technical workshops across EMEA and the Middle East.

With over 20 years of hands-on experience building the web in fintech, hospitality, and eCommerce, my background directly mirrors the technical leadership and client-facing requirements of this role:

- **Financial Infrastructure & Core Banking Integrations:** As Co-Founder and Architect of Walletry, I engineered an early PCI DSS compliant payment gateway in PHP and Symfony that handled 33% of all domestic air travel ticketing volume. I designed atomic transaction state machines integrated directly with domestic acquiring banks and the Amadeus Global Distribution System (GDS), backed by clustered MySQL master-slave replication and asynchronous CLI daemons for batch financial settlements.
- **High-Concurrency Transactional State Machines:** Contracting for the Saudi Ministry of Standards (SASO), I architected nationwide vehicle inspection booking infrastructure. To resolve severe multi-channel booking contention, I engineered a deterministic 5-minute transactional state-locking engine that completely eliminated race conditions across web, mobile, and backend channels, supported by normalized 3NF transactional schemas and Star Schema analytics views.
- **Decoupled Enterprise Portals & API Architectures:** Backbase's roots in engagement portals and modular banking solutions align with my extensive delivery of decoupled architectures. I have led enterprise projects implementing versioned REST APIs, OpenAPI contract synchronization, SAML 2.0 / Keycloak Single Sign-On (SSO) federation, and multi-tier edge caching hierarchies (Redis and Varnish) sustaining sub-50ms latencies under heavy load.
- **Client Leadership & Solution Governance:** Throughout my career, I have operated at the intersection of business strategy and deep engineering execution. I am equally comfortable leading technical inception workshops with development leads and presenting architectural roadmaps to C-level stakeholders. I enforce deterministic CI/CD automation, strict non-functional requirements (security, sizing, caching, high availability), and structured developer enablement.

Backbase's mission to transform traditional banking into a unified, modular Engagement Banking Platform requires architects who understand both the mechanics of money movement and the realities of enterprise delivery. I welcome the opportunity to discuss how my software architecture experience can support your regional banking implementations.

Thank you for your time and consideration.

Sincerely,

Alex (Eskandar) Seif
